# A Business App For People

---

Report by The UdaPeople Team

# The goal here is to get this App to market on time

Here is how we achieve that

---

The end game of this project is to provide companies a useful tool to improve their bottom line

Satisfied employees are more productive when they feel well taken care of.

With our Continuous integration tools, our automated processes mean we build, test, and put together the app simultaneously - we reduce time to production and use less resources therefore decreasing the cost of production.

# Continuous Deployment

We don't have to put all functionalities we can think of in the first build. After the app has been launched, with continuous deployment, we can make regular improvements on the app monthly, weekly or even daily with no fear of downtime of the app so we are assured of no interruptions to our revenue stream

In essence, continuous delivery guarantees us low production cost and faster time to market while the continuous deployment would ensure customer satisfaction, improved revenue generation and a continuous positive loop
